

# Recent research supports the strategies for identifying and precluding potential dental procedures

Oana Almasan

Department of Prosthetic Dentistry and Dental Materials, "Iuliu Hatieganu" University of Medicine and Pharmacy, Cluj-Napoca, Romania

Dear Editor,

With considerable enthusiasm, I perused the research by Chifor R. and co-authors (Chifor R, Badea IC, Dascalu (Rusu) LM). Preventing overtreatment in dentistry: causes, types and how to be avoided. *Ro J Stomatol.* 2022;68(2):63-68) on techniques for identifying and preventing possible dental procedures [1].

I would like to compliment the authors for their thoughtful review and give a few more thoughts.

According to the cited study, it is essential to recognize and identify the rationales of potential overtreatments as soon as feasible and to behave professionally to accomplish positive outcomes in preventing them. The results of the study highlight that besides ones relating to economic profit or organizational growth, the majority of the overtreatments were performed inadvertently [1].

The contemporary period encourages and motivates the dental profession to overcome unessential therapeutic interventions.

Conquest et al. evaluated the relevant worldwide research on capped-fee and fee-for-service funding
